Content

- 1 Background on risk management
- 2 Key issue
- 3 Prevention cultures as negotiated process
- 4 Conclusion
- 5 Outlook

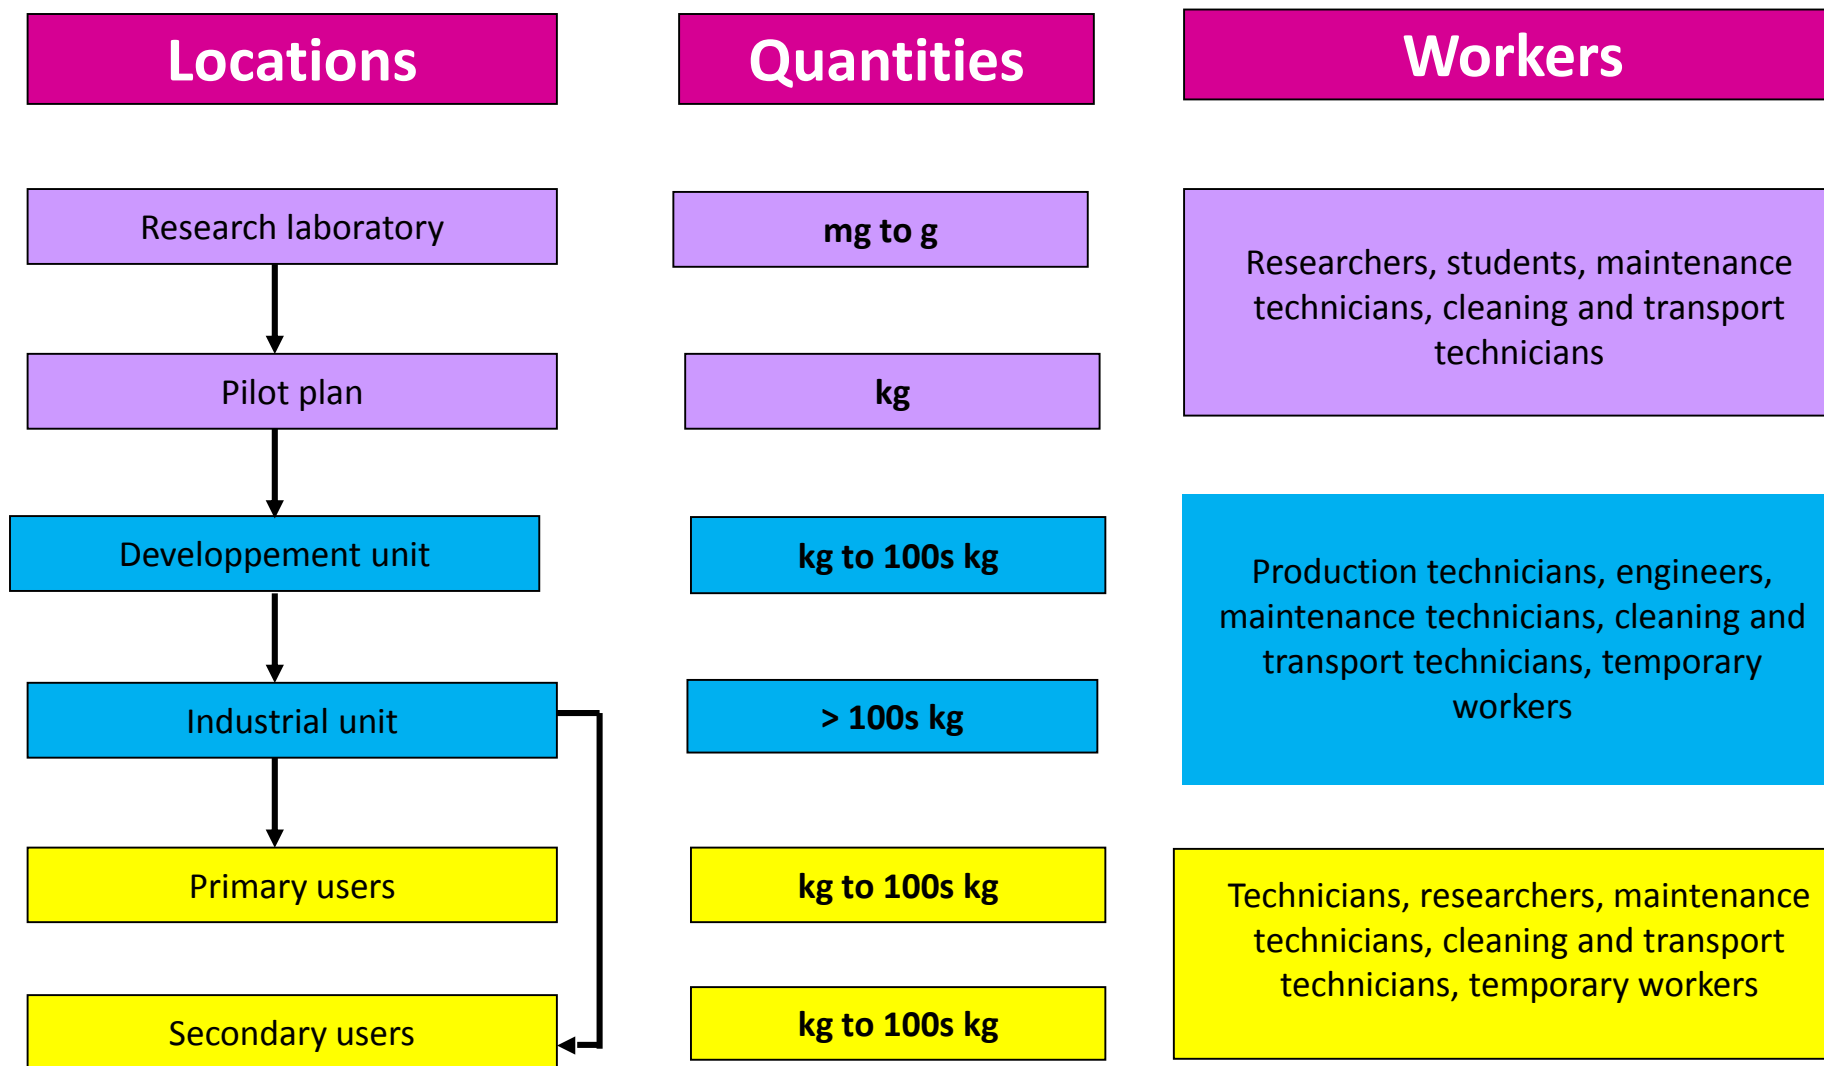

Background

Occupational exposures as a priority goal

Source: Royal Society. (2004). Nanoscience and nanotechnologies: Opportunities and uncertainties. London: Royal Society, p. 37.

Plenty of nanomaterials exposures at the workplace

Main challenges towards nanomaterials risk management

HAZARDS

EXPOSURES

PREVENTION

Needs in datas

Guidances, standards and regulations increase

- Definitions : ISO, Scenhir, etc.
- Registries : R-Nano, etc.
- Occupational Exposures Limits : NIOSH, INRS, etc.
- Risk assessment methods : CB, NanoSafer, etc.

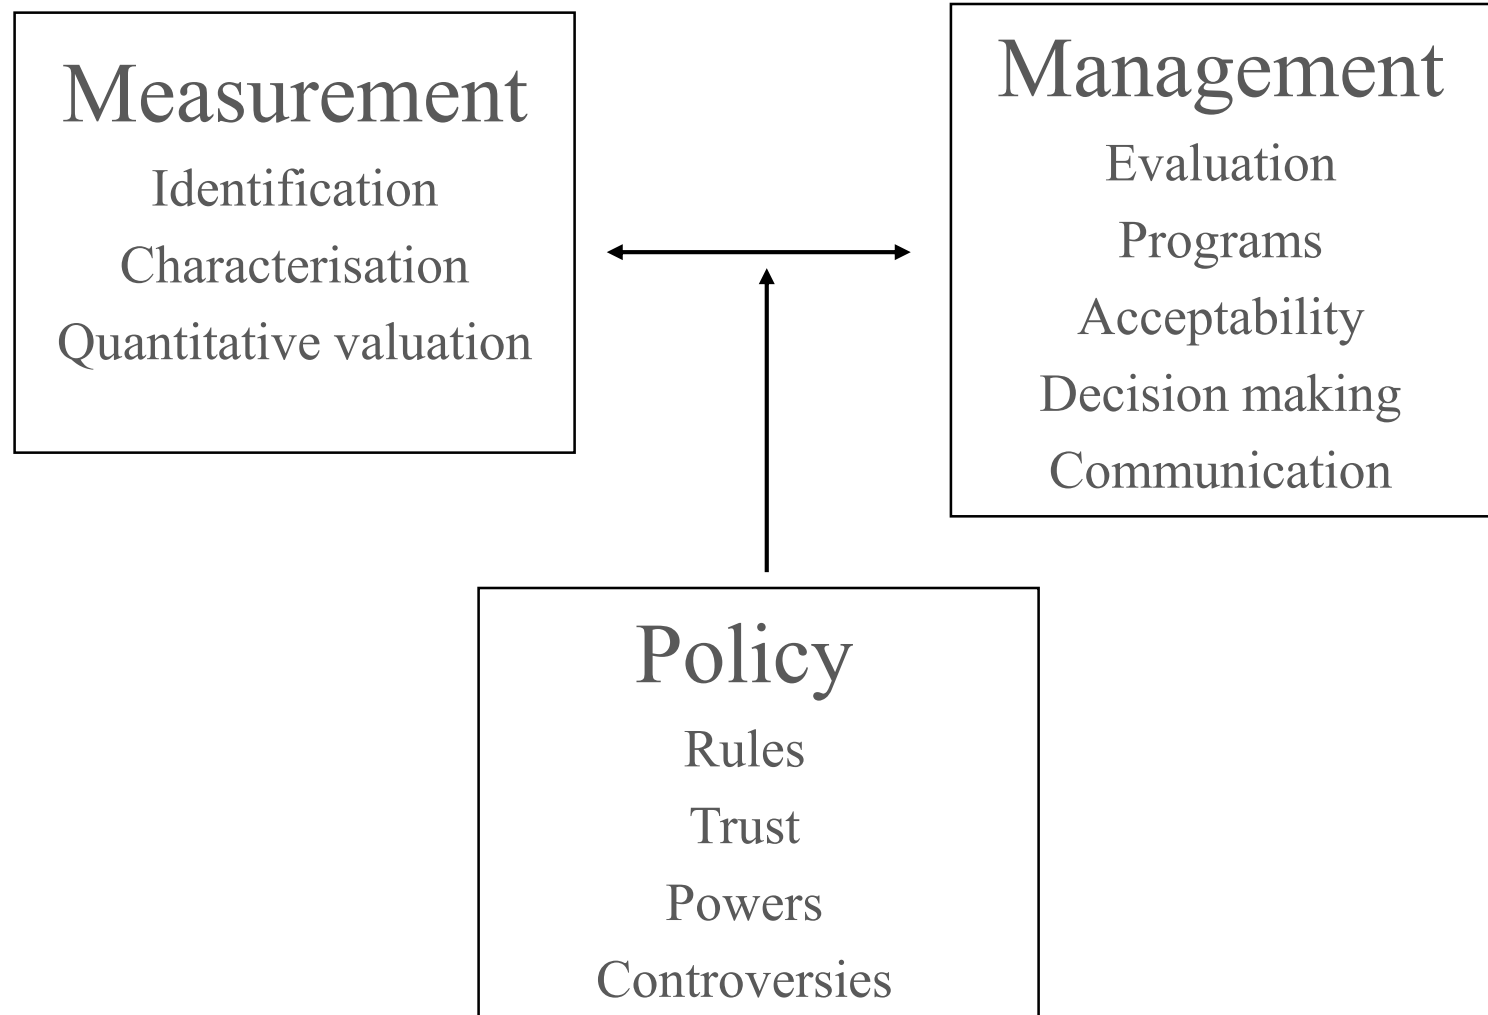

Key issue

Approaches in risk management remain dispersed

Risk management: permanent redesigning and tinkering

Many alternatives in risk management: an example

- ✓ Control banding (ANSES)
- ✓ Decision tree
- ✓ NanoSafer
- ✓ Etc...

Bandes de maîtrise :

BM1 : ventilation générale

BM2 : ventilation locale

BM3 : vase clos

BM4 : consulter un spécialiste

		Bandes de potentiel d'exposition				
		- —————> +				
		BE1	BE2	BE3	BE4	
Bandes de danger	-	BD1	BM1	BM1	BM1	BM2
	BD2	BM1	BM1	BM2	BM3	
	BD3	BM2	BM2	BM3	BM4	
	+	BD4	BM3	BM3	BM4	BM4

Hybridization between precaution and prevention principles

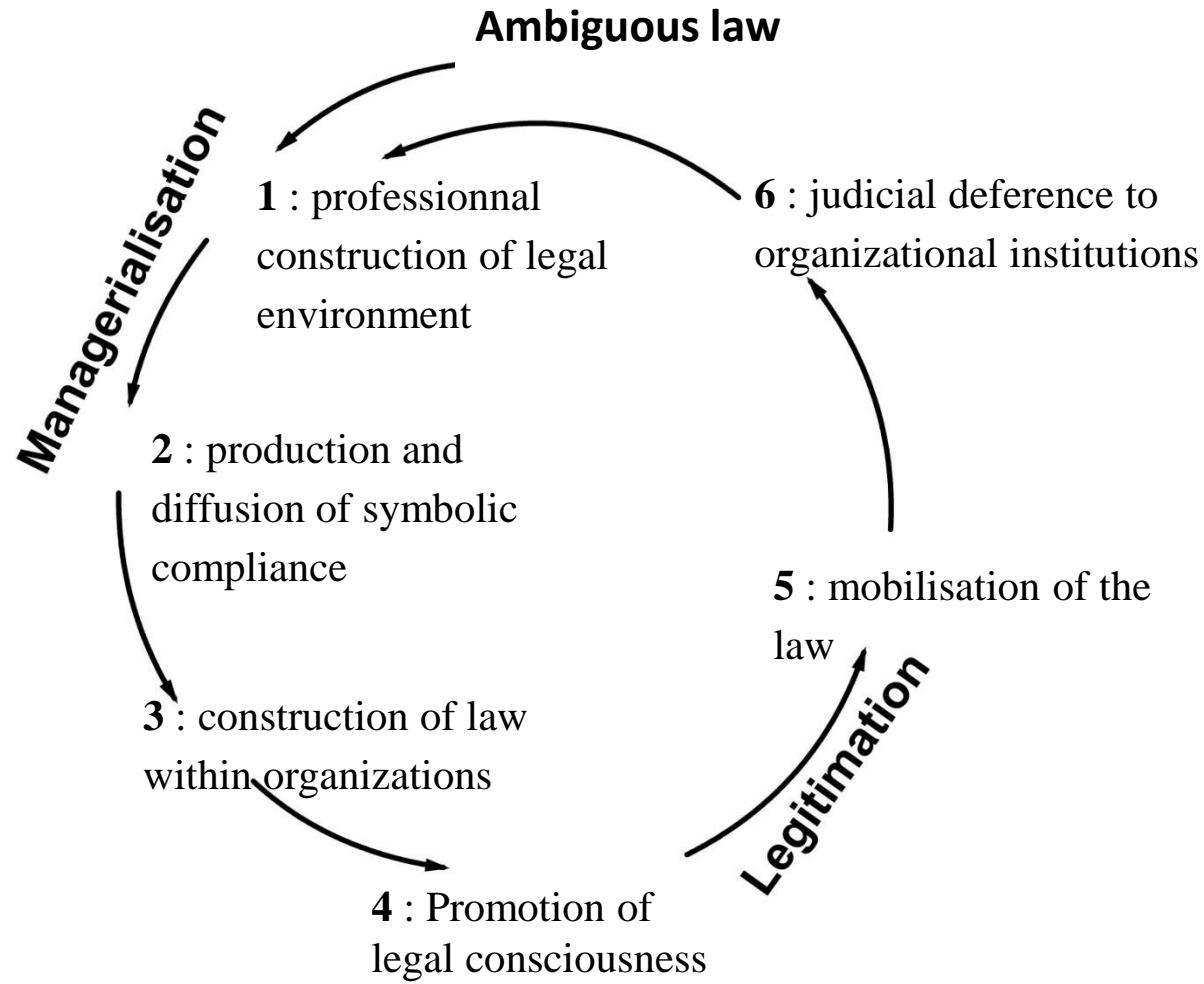

Precaution	Prevention
Environnemental law	Labor law
Public health	Occupational health
Public authority responsibility	Employer responsibility
Research process	Evaluation process
Obligation of means	Obligation of results
Temporary	Permanent

Hybridization between precaution and prevention principles

EHS policies :

- « X is supporting a risk management based on case-by-case approach where the precautionary principle is adjusted according to experts advice »
- « Y manage a multidisciplinary community to assess the safety of potential exposed workers and to deliver reasonable measures in case of suspected risks »

The endogeneity of Law (L.B.Edelman)

Prevention cultures as negotiated process

A comparative study between french and american labs

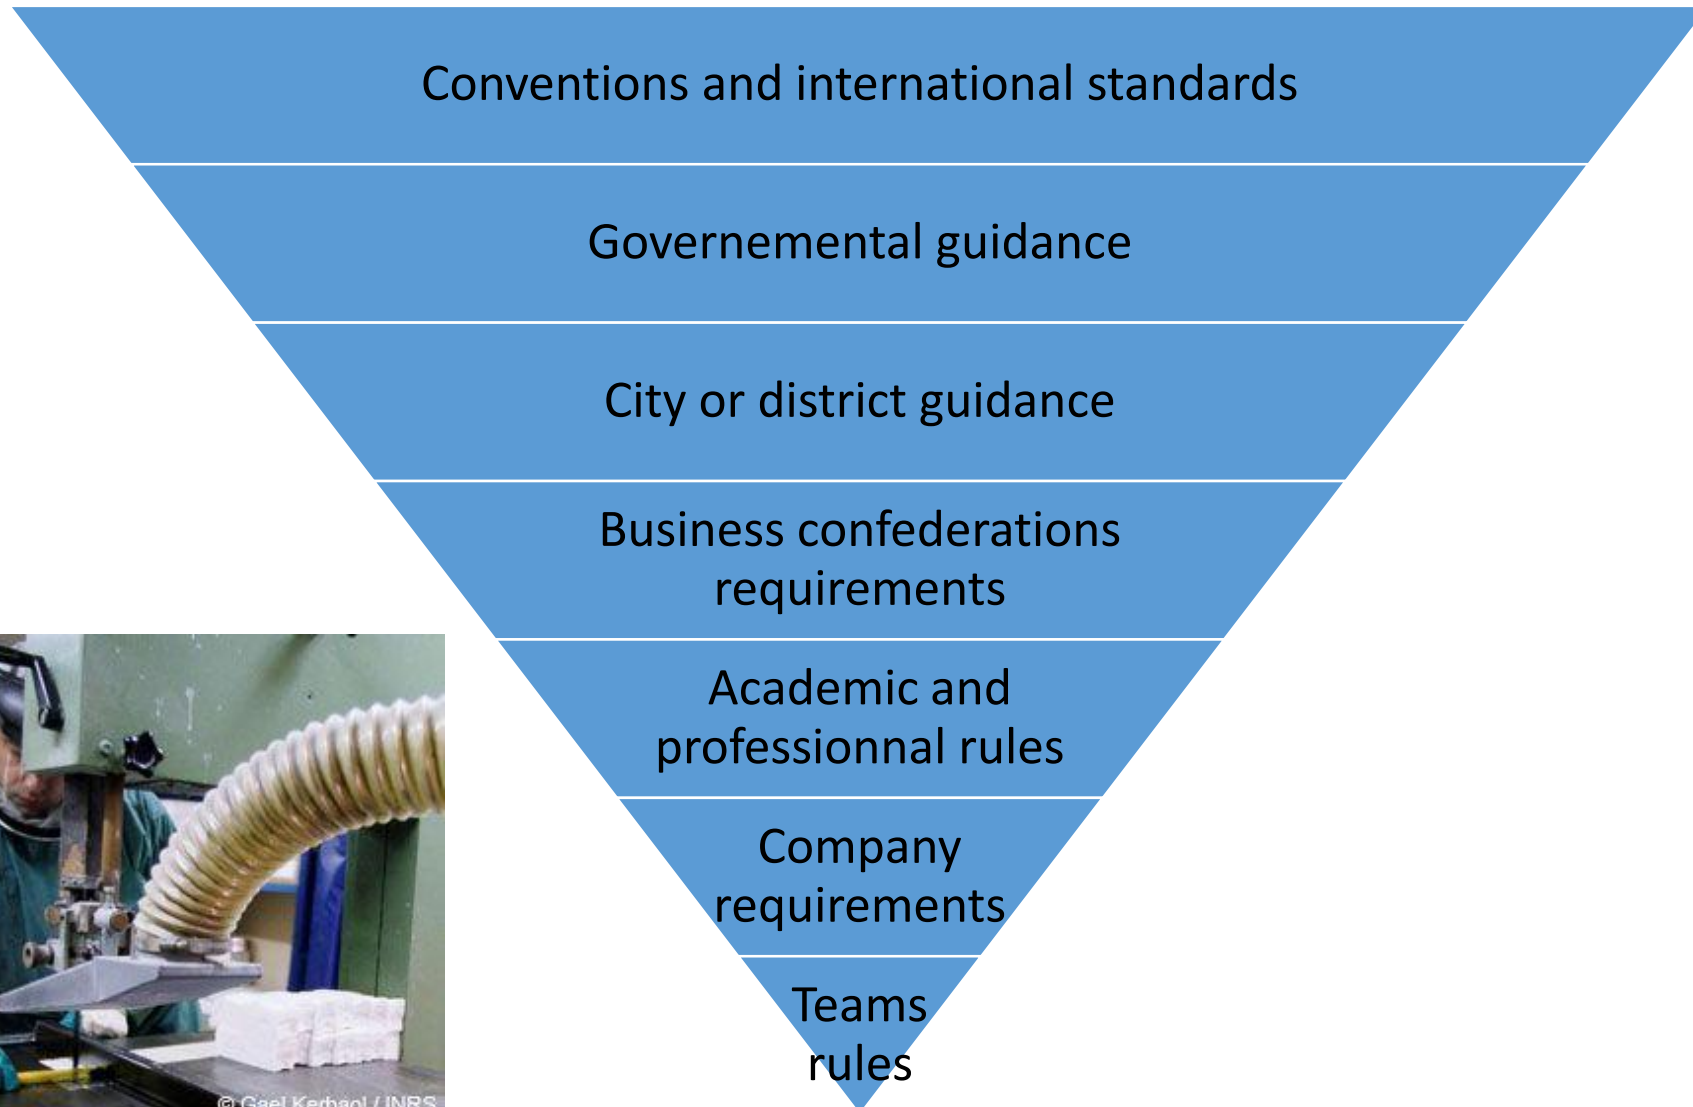

IDEX Paris-Saclay, ANR-11-IDEX-0003-02 + PEPS CNRS

Thanks to Susan SILBEY (MIT) and Jérôme PELISSE (Sciences Po Paris)

Four laboratories observed

Fields	France	United States (MA)
<p>Nanomedecine</p> <p>Translational and applied focus, organic materials in large labs</p>	<p>Nanocap Laboratory</p> <p>(Saclay, CNRS-University)</p> <p>Liposomes, polymers</p> <p>120 members</p>	<p>BS Laboratory</p> <p>(MIT)</p> <p>Polymers</p> <p>170 members</p>
<p>Nanoelectronic</p> <p>Basic and more fundamental focus, mineral materials in smaller labs</p>	<p>Carbon Lab</p> <p>(Saclay, CNRS)</p> <p>Carbon nanotubes and metallic particles</p> <p>30 members</p>	<p>Cristal Group</p> <p>(MIT)</p> <p>Cadmium and heavy metals. Quantum Dots</p> <p>25 members</p>

A same risk management framework

Typical organizational prevention cultures

Safety conditions	France	USA
Resources	Nanocap Laboratory EHS guidelines EHS officers Regular safety training	BS Laboratory Strong EHS management system MIT dedicated EHS officers for nanohazards EHS representative in labs Biosafety training before entry
Work division		Strong work division between graduates and PI and between different research fields Many temporary workers (graduates, etc.) with high turnover
Control	Control by peer Compliance	Control by principal investigators (PI) and lab' administrators Potential safety drifts and failures
Results	Safety as per professional rule	Safety as obligation
Safety culture	Carbon Lab EHS guidelines EHS officers Control by peer Compliance Safety as per professional rule	Cristal Group MIT management system Few graduates with low turnover (graduate thesis duration=4 years) Safety rotating responsibilities Informal neighborhood team control High safety level Safety as ethical imperative

Risk management: permanent compromises

Workers

Law intermediaries

Researchers,
Technicians,
Engineers

EHS officers,
Managers,
Consultants

Rules

Conclusion

Clarifying priorities and values for risk management

HAZARDS

EXPOSURES

PREVENTION

Judgment criteria...

Organizing effective consultation and participation about risks

- Representation of the various recipients
- Sufficient time
- Debate rules
 - Free participation
 - Possible controversies
 - Decision mode commonly agreed
 - Consensus
 - Vote
 - ...
 - Etc.

Outlook

The scientist and the reflective work: from science to law
