- Drastic increase in Number of Publications increases drastically

Source: Nau K. et al (2016), The DaNa2.0 Knowledge Base on Nanomaterials – Communicating current nanosafety research based on evaluated literature data. Journal of Materials Education Vol. 38 (3-4): 93-108 (2016)

Krug H.F. (2014). **Nanosafety research— are we on the right track?** *Angew Chem Int Ed Engl*, 53(46): 12304-12319.

Literature Review on 3 major uptake pathways & comparison Instillation vs Inhalation

- Majority of studies was poorly conducted
- Characterisation of NM was insufficient
- Applied dosage in most cases under overload conditions
- **Results NOT applicable for risk assessment!!!**

*„When things are large, they are what they are. When they are small, it's a different game: **they are what our measurements make them.**”*

(George M. Whitesides, No Small Matter. Science on the Nanoscale)

Fadeel B., Fornara A., Toprak M.S., Bhattacharya K. (2015). Keeping it real: The importance of material characterization in nanotoxicology. *Biochem Biophys Res Commun.* Doi: 10.1016/j.bbrc.2015.06.178

Key challenge for nanosafety assessment & safe-by-design approaches is to

- Understand which phys.-chem. properties are driving the nanomaterials' toxicity
- Standardised testing methods & materials
- Dose & dosimetry in Nanotoxicology
- Naming & categorizing nanomaterials

- Quality standards for (nano)toxicological studies
- Physico-chemical characterisation **fit-for-purpose & relevant** for addressed purpose
- Validated standard methods & reference materials
- Relevant models & concentrations

Key Tasks of the DaNa - Knowledge Base Nanomaterials (DaNa = Database Nanomaterials)

- Communication of current nanotechnology safety research
 - Scientific Literature Review & Quality Management
 - Collecting – Evaluating & Processing of Nanosafety Information for Website
 - for Interested Laymen, Stakeholders, Scientists
 - Website www.nanoobjects.info  
- Support for German Nanosafety Research projects
 - NanoCare, NanoNature, ERA-Net SIINN

The screenshot shows the 'Methodology of selection, acquisition and evaluation of toxicological publications in the Project DaNa' document. It lists assessment criteria, divided into mandatory and desirable. The mandatory criteria include physico-chemical properties, sample preparation, testing parameters, and general aspects. The desirable criteria include physico-chemical properties like crystallography and surface reactivity.

DaNa Literature Criteria Checklist

→ Mandatory & Optional Criteria

Methodology of selection, acquisition and evaluation of publications in the Project DaNa^{2.0}

Paper:			
Assessment Criteria	must	might	fulfilled?
1. Physico-chemical NM properties (powders or suspensions as prepared or delivered):			
Name of substance (or CAS-No), form of delivery (powder, suspension)	X		
Chemical composition: Purity, contaminations (e.g. elements, element concentrations, endotoxins)	X		
Particle size, size distribution in suspensions (incl. dispersion medium)	X		
Specific surface area of powders (e.g. BET surface)	X		
Surface chemistry (functionalisation, hydrophobic, hydrophilic, ...) / coatings / modifications	X		
Morphology (shape)	X		
Crystallography (crystalline or amorphous phase); phase analysis (pure or mixed)		X	
Surface reactivity and / or surface charge (zeta potential, isoelectric point)		X	
Formation of radicals, (photo-)catalytic activity		X	
Porosity, defect density, magnetic properties		X	
2. Sample preparation (dispersion of as prepared or delivered NM in media used for biological experiments)			
Dispersion procedure described in detail? (Type of medium used, preparation of stock solution or direct dosing, way of dispersal, energy input, nominal concentration)	X		
Extent of agglomeration / aggregation resp. particle size distribution under experimental conditions (e.g. culture medium, nutrient solutions w/o proteins)		X	
Water solubility (discriminate between soluble, metastable and persistent particles; metastable: soluble within days or weeks)		X	
3. Testing parameters:			
Controls (positive and negative controls), check for interferences	X		
Concentration administered: in $\mu\text{g/ml}$, $\mu\text{g/cm}^2$; N (particle)/cell or pg/cell	X		
Dosage used classified clearly to be "non-overload" or "overload conditions"	X		
Method 1 for biological endpoints	X		
Additional 2nd method for biological endpoints		X	
Use of reference material		X	
4. General aspects:			
Data evaluation / statistics	X		
Criteria of standardisation (e.g. SOPs used, OECD guidelines)		X	
Final evaluation:			
Evaluated by:			Date:

Dispersion of Carbo-Iron® Suspensions for Ecotoxicological Testing

1. PURPOSE

This SOP describes the preparation and application of Carbo-Iron suspensions to be used in subsequent ecotoxicological tests. Dispersion is considered a crucial step in toxicity testing, hence, the preparation of a nanomaterial stock suspension has to follow a reproducible procedure in order to ensure e.g. stability of the dispersion over the anticipated test duration.

2. OBJECTIVE

Standardized toxicological testing of suspended nanomaterials involves the preparation of stock suspensions from nanomaterial powder in a reproducible manner. Carbo-Iron is a nanostructured composite material made of zero-valent iron and activated carbon. It is applied in groundwater remediation by injecting a carboxymethyl cellulose (CMC) stabilized Carbo-Iron suspension into the aquifer. Based on this technical approach, Carbo-Iron stock suspensions are stabilized with CMC before transfer into the test media. CMC is increasing the colloidal stability of the particles and prevents their agglomeration. Due to the need of oxygen for the organisms in ecotoxicological tests, it has to be accepted, that zero-valent iron as part of Carbo-Iron oxidizes and loses its reactivity while dispersing. Ecotoxicological studies are therefore carried out on aged material. Suspension preparation prior to ecotoxicological testing is based on a two-step approach. First, dispersion of Carbo-Iron is conducted by ultrasonication in order to achieve a deagglomerated stock suspension. Second, serial dilutions are prepared from the stock suspension by adding a CMC-water suspension. These dilutions are added to the respective test media in a fixed ratio.
