

Editorial

Dear Colleagues,

The IRIG's scientific newsletter allows us to end the year 2020 by putting Science in the spotlight, which is very fortunate. The results described in it come to show us, if needed, that the Institute's teams held the lead during the "COVID storm". As we have become accustomed to, we discover through this letter the advances in such varied fields that we have the opportunity to surf with ease from skyrmions to viruses through plants and ultra-low temperatures. Delight yourself!!!

COVID will have marked the year 2020 by sustainably transforming our professional and family lives. In order to avoid an even more serious health crisis, our laboratories and equipment have been forced to operate in slow motion or even to close. While waiting for the benefit of a massive vaccination to be felt, we remain deprived of the spontaneous and daily gestures that were so many expressions of attention or affection. Our social life obviously suffers from such a situation. Even if everyone has been able to adapt, this turmoil is anything but insignificant for our personal lives and for the life of our research structures. The impact has been significant for the IRIG which is a young institute. The strengthening of the institute requires increased exchanges, both spontaneous and initiated, in order to allow each UMR to go beyond its own strategy by seizing opportunities that arise to develop interdisciplinary projects for which IRIG is particularly well equipped. Initiatives will be rapidly proposed in 2021 by the Institute's management in order to create such opportunities, notably within the framework of the adjustments that have been put in place by the CEA in 2019 in the fields of quantum, the circular carbon economy, batteries, organ-on-chip and health innovations in the fields of diagnostics and therapeutic approaches.

The beginning of the year 2021 will be marked by the arbitrations which will be rendered within the framework of the CPER and the EQUIPEX+. The expected funding should support innovation and the further development of leading-edge instrumental platforms in Spintronics, Structural Biology, Proteomics, NMR and in the fields of materials characterization and data management and analysis. It is therefore an important opportunity for the IRIG given the place occupied by these platforms in our research programs. The renovation of the buildings will also be a strong priority in 2021. Although the amount of investment required is considerable, new projects will be launched. These are long-term projects for which the management of the DRF and the CEA's Heritage Department are working with us; I would like to thank them for their support.

The year 2021 is almost here; it will allow us to gradually see the fading away of everything that may have made the period we have gone through difficult. I hope that this new year will be synonymous with hope and envy for all of us, that it will bring new promises and success in the work that you will carry out.

I wish you a Merry Christmas and a Happy New Year!

Jérôme Garin, Head of the Interdisciplinary Research Institute of Grenoble

A new model of cell mechanics

The mechanical forces produced by the cells play a fundamental role: they influence the shape, movement, divisions and differentiation of the cells. The mechanism by which they are generated and distributed throughout the cell remains unknown.
